

DESIGN SUPPORT BRIEF

Why This MCP Makes Bob Better

A one-page framing brief to position the MCP as Bob augmentation, not Bob replacement.

Audience: Presentation design team

Objective: Show that the MCP strengthens Bob's judgment instead of taking Bob's work away

Source basis: Repo analysis plus passing build and test verification

Core message: This MCP does not do Bob's job for him. It gives Bob repo-wide evidence, repeatable analysis, and durable outputs so Bob's recommendations become faster, sharper, and more defensible.

Strong Points Designers Can Build Around

1. Bob stays in charge

Bob still chooses the tools, the path, and the final recommendation. The experience stays human-centered instead of becoming a black-box script.

4. Bob can justify direct vs staged

The MCP compares upgrade paths with explicit risk and effort scoring. Bob can explain why the safer or faster route wins for this repo.

2. Bob gets repo-wide x-ray vision

The MCP looks across runtime pins, lockfiles, CI, Docker, deployment config, and risky source patterns, so Bob misses fewer hidden blockers.

5. Bob creates durable artifacts

The output is more than chat: decision, evidence, tool trace, execution plan, and validation checklist become a shareable modernization report.

3. Bob gets repeatable evidence

Findings come back as typed issues, evidence, and validation steps. That makes the recommendation easier to trust, review, and reuse.

6. This is safe augmentation

The MCP inspects and recommends without silently changing the analyzed repo. It feels like instrumentation, not takeover.

Design Direction

Emphasize

Bob with x-ray vision
Evidence-backed judgment
Reusable modernization artifact

Show

User -> Bob -> MCP tools ->
evidence -> report -> Bob
recommendation
Bob still centered in the flow

Avoid

Autonomous robot imagery
Black-box AI magic
Messaging that implies Bob is
being replaced

"Bob stays the strategist; the MCP supplies the instrumentation."

Verification note: This brief is grounded in a full repository review. The project build passed and the automated test suite passed at the time of analysis.
